The molar enthalpy of reaction $\left(\Delta H_{r x n}\right)$ is the amount of heat transferred during a reaction. It is reported in kilojoules per mole of reactant. A reaction that produces heat is exothermic and has a negative $\Delta H_{r x n}$. A reaction that absorbs heat is endothermic and has a positive $\Delta H_{r x n}$.

## Example

How much heat is produced when 85 g of sulfur reacts according to the reaction below?

$$
2 \mathrm{~S}+3 \mathrm{O}_{2} \rightarrow 2 \mathrm{SO}_{3} \quad \Delta \mathrm{H}=-792 \mathrm{~kJ}
$$

- the $\Delta H$ value given in the equation is the amount of heat transferred when 2 moles of sulfur and $\mathbf{3}$ moles of oxygen react.
- write the 'given' and 'unknown' units:

- fill in factors:

$$
\frac{85 \mathrm{~g} \mathrm{~S}}{1} \times \frac{1 \mathrm{~mol} \mathrm{~S}}{32.06 \mathrm{~g} \mathrm{~S}} \times \frac{-792 \mathrm{~kJ}}{2 \mathrm{~mol} \mathrm{~S}}=
$$

- solve:

$$
\frac{85 \mathrm{gS}}{1} \times \frac{1 \mathrm{mols}}{32.06 \mathrm{gS}} \times \frac{-792 \mathrm{~kJ}}{2 \mathrm{molS}}=-1050 \mathrm{~kJ}
$$
